

The Leader in Aquatic Technology

Introducing Our NECCSYS System

(Natatorium Environmental Communication and Control System)

NECCSYS by Carrico Aquatic Resources Inc. is a one of a kind swimming pool control system that allows for control of all major aspects of a mechanical operation including pumps, filters, disinfections systems, chemical feed systems, and air handling systems.

What sets NECCSYS apart from any other system is the proven technology of utilizing a real time combined chlorine reading from the water as a trigger to turn up or down the mechanical systems to provide the best possible water and air quality.

This communication takes place using 4-20 ma outputs between the system and the mechanical equipment. also NECCSYS has the ability to communicate using MODBUS and BACNET protocols.

While developing the NECCSYS system Carrico Aquatic Resources discovered that there was tremendous energy savings potential in exhausting pool air only when needed. These findings have been validated by Focus on Energy which is now working with pool owners to offer financial incentives and savings based financing to get the NECCSYS system installed on pools all over Wisconsin.

The NECCSYS system is comprised of the best commercial swimming pool equipment on the market.

- BECSys chemical controllers
- Pulsar disinfection systems
- H2FLOW VFD's
- Medium Pressure UV
